PIPELINE

ORCHESTRATOR

Manage the total order lifecycle

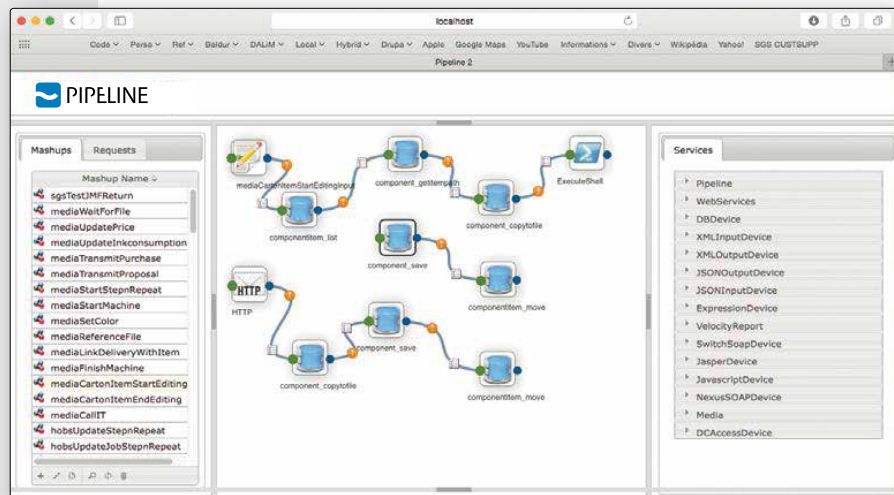

PIPELINE and ORCHESTRATOR are integration software products from HYBRID Software which allow customers to manage their internal processes and drive production from customer orders by leveraging data from existing systems including Management Information Systems (MIS) or other data repositories.

Manage the total order lifecycle

PIPELINE includes support for all major databases as well as orders specified using standard formats such as XML or JDF. It provides connectivity with software solutions that manage the full order lifecycle including online ordering portals, MIS/ERP data for jobs and items, customer details from CRM systems, and billing information linked directly to accounting systems.

Right side:
With an extensive set of tools, PIPELINE can connect different systems together such as linking the SAP ERP system to a production workflow, as shown above

Below:
The open HYBRID Data Connector API enables standard connection with any system

```

ORCHESTRATOR

Process Improvement

ORCHESTRATOR allows real improvements in efficiency by connecting external and internal processes and data. Examples include managing file delivery and preflight, organizing item creation and customer approval of print-ready files, management of tooling, automating imposition and step and repeat, and many other functions. Users can describe and set up specific processes for each stage involving internal and external users.

Right side:

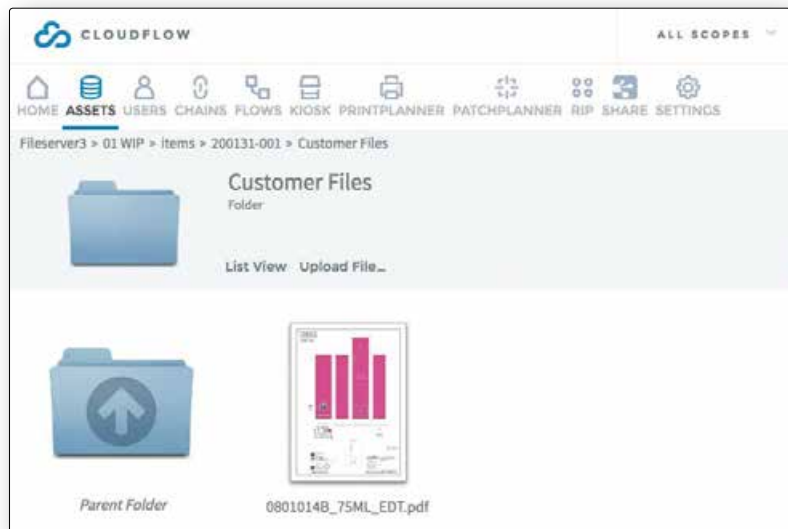

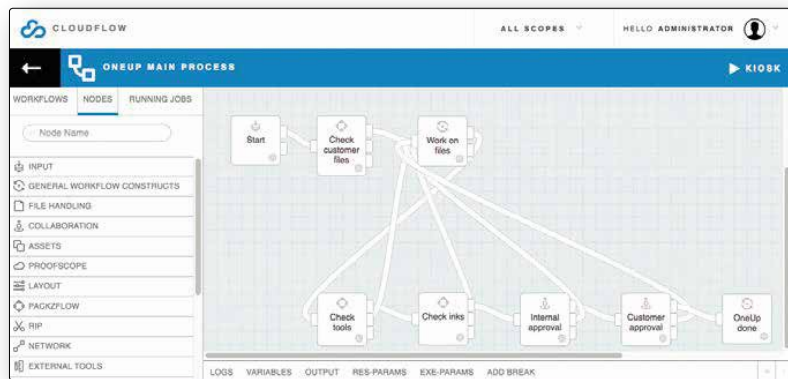

True process automation provides greater efficiency in communication between production and the customer.

Compatibility with Existing File Structures

ORCHESTRATOR has a unique approach to connect production files with order information by linking MIS/ERP software to existing file structures. Adapting new processes can then be done without having to rebuild existing production workflows.

Right side:

By creating a link between orders, job tickets, and production files, ORCHESTRATOR can manage the automated creation of mixed forms.

HIGHLIGHTS

- Full connectivity with XML, JDF, databases, and even proprietary systems
- Link Order Lifecycle with MIS, ERP, CRM, accounting, etc.
- Open API for data connections
- Compatible with existing job structure
- Control of process milestones
